NSK

SOLUTIONS FOR PAPERMAKING MACHINES

BRANDS OF **NSK EUROPE**

NSK RHP *bearings* PPL

OUR MOST IMPORTANT PRODUCT: OUR CUSTOMERS' STATISFACTION

We are among the leading manufacturers for rolling bearings, linear technology components and steering systems worldwide. We can be found on almost every continent – with production facilities, sales offices and technology centres – because our customers appreciate short decision-making channels, prompt deliveries and local service.

The NSK company

NSK commenced operations as the first Japanese manufacturer of rolling bearings back in 1916. Ever since, we have been continuously expanding and improving not only our product portfolio but also our range of services for various industrial sectors. In this context our worlwide research and production facilities are linked together in a global network. Here we concentrate not only on the development of new technologies, but also on the continuous optimisation of quality – at every process stage. Among other things, our research activities include product design, simulation applications using a variety of analytical systems and the development of different steels and lubricants for rolling bearings.

Bearing Maintenance and Inspection 32

THE HIGH QUALITY AND TOUGHNESS OF NSK BEARINGS REDUCE MAINTENANCE COSTS IN THE PAPERMAKING INDUSTRY

Bearings used in papermaking machines are operating under high-temperature conditions. These bearings are vulnerable to problems such as fracturing of the inner ring, which can result in work stoppages. NSK bearings, with their long service life, superior resistance to inner ring fractures, outstanding hardness, and excellent dimensional stability under high temperatures, produce solutions for a host of paper mill applications and operating environments.

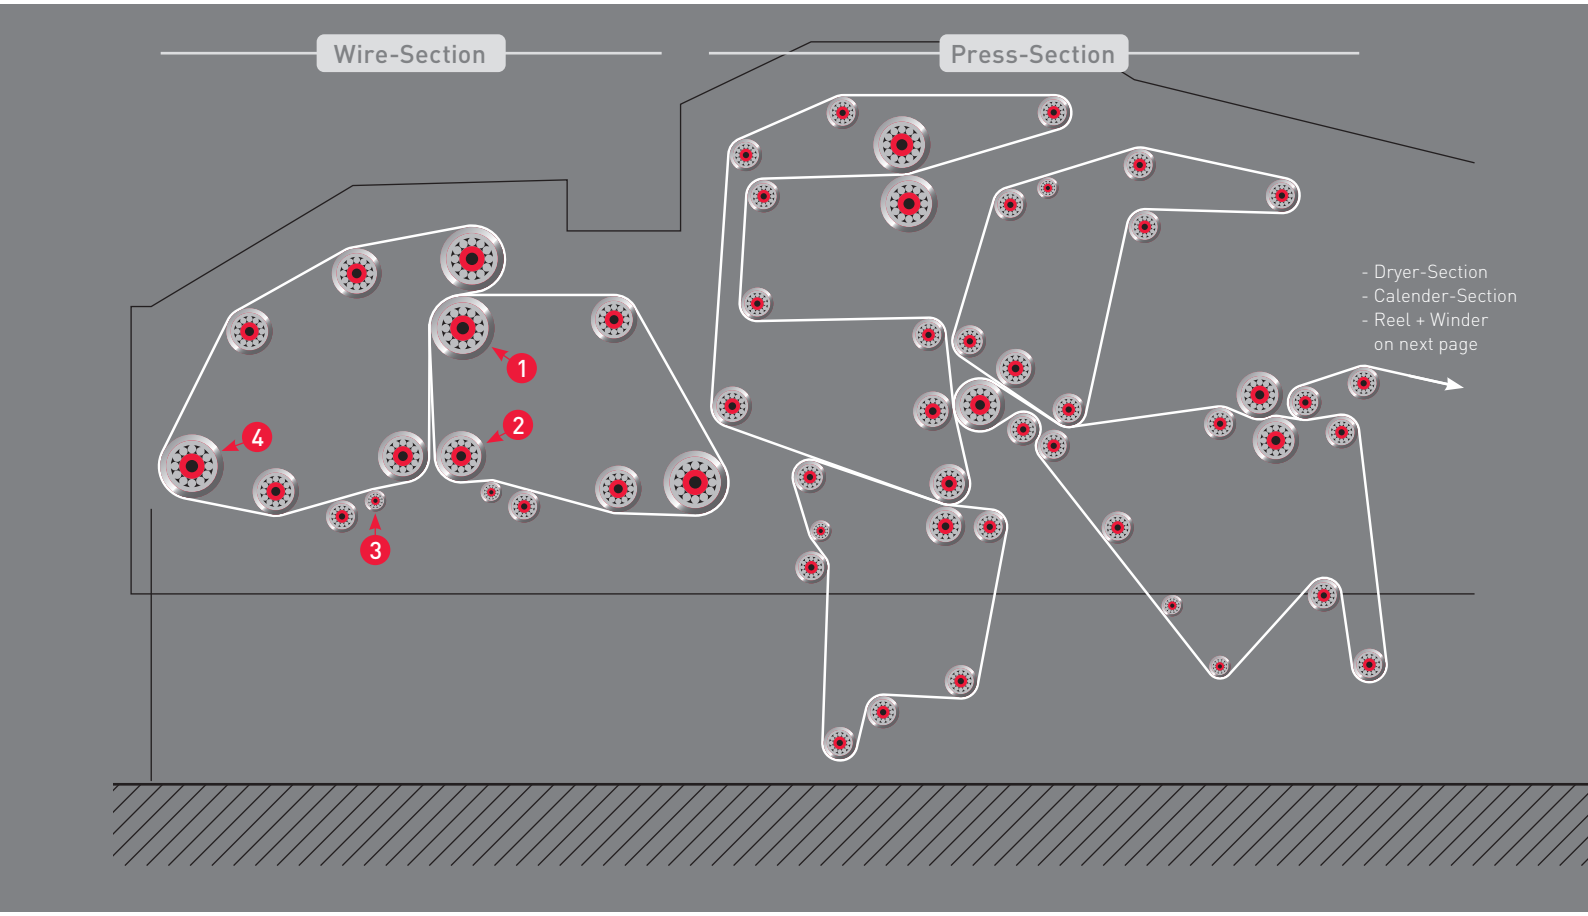

THE PAPERMAKING PROCESS AND SPHERICAL ROLLER BEARING SPECIFICATION – WIRE- AND PRESS-SECTION

3. 223XX
4. C3 / P6
5. Oil bath

Spherical Roller Bearings – TL Series

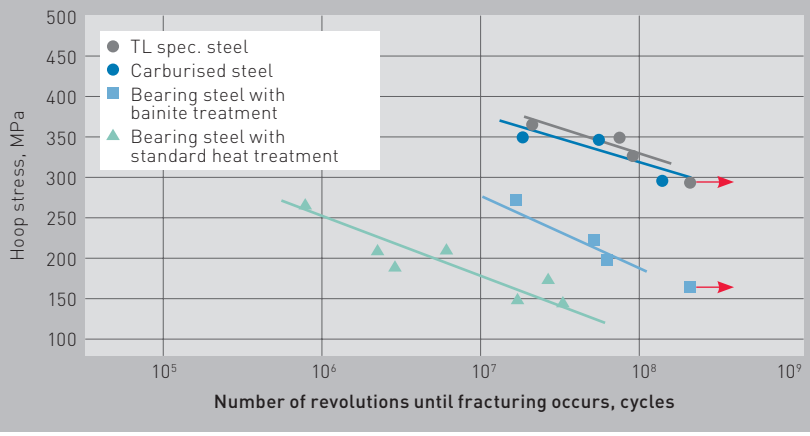

Dryer rolls are generally used under high-temperature conditions, which can lead to fracturing of the bearing inner ring, and in the worst case, result in work stoppage. NSK's solution is the TL (Tough and Long-life) bearing, which features sufficient strength to resist inner ring fractures, superior dimensional stability under high- temperature conditions, and long life due to superior hardness. All these characteristics mean improved productivity.

Features

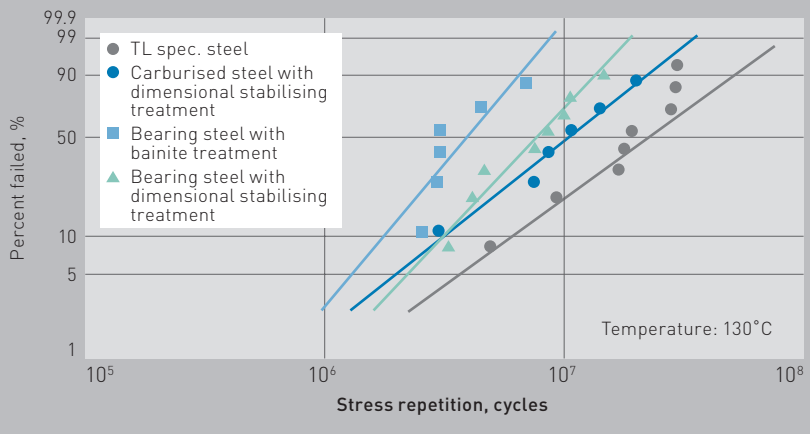

Enhanced inner ring strength

Adoption of a special steel and surface hardening heat treatment, developed by NSK, dramatically enhance inner ring strength against increasing hoop stress caused by rising shaft temperature.

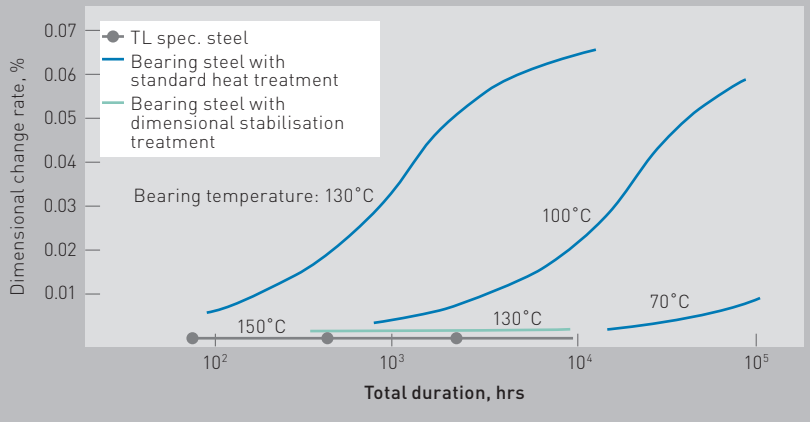

Longer life

Increased hardness of raceway surface provides longer life when foreign debris is present compared to other bearings.

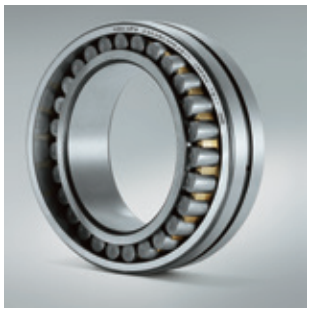

Dimensional stability under high temperatures

High-temperature dimensional stabilisation of up to 200°C has been achieved through the application of NSK's proprietary material heat treatment technology.

High Performance Standard Bearings for Industrial Machinery

NSKHPS, redefining the standard

Continually developing products with greater strength and higher accuracy, NSK's new NSKHPS fully incorporate the advantages of NSK's world-class design, materials, and manufacturing technologies, setting a new standard for bearings.

Features, compared with conventional bearings

Bearing life **2 times longer** (maximum)

Limiting speed **20 % higher** (maximum)

Working temperature up to **200°C**

1. Improved reliability

Bearing life has increased by a maximum of 2 times compared to conventional bearings by optimisation of the bearing's internal design and improved processing technology. As a result, the NSKHPS bearings contribute to reducing maintenance costs and facilitate the downscaling of related equipment.

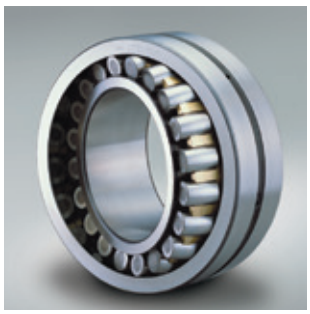

2. Improved limiting speed (EA type)

Limiting speed has been increased by a maximum of 20 % compared to conventional bearings by improving cage wear resistance.

3. High temperature dimensional stabilizing treatment comes standard

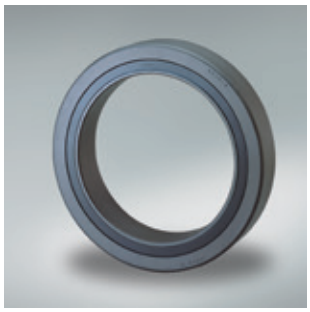

High-temperature dimensional stabilization of up to 200°C has been achieved through the application of NSK's proprietary material heat treatment technology. As a result, this series of bearing can be used in a wide range of applications.

Spherical Roller Bearings – CA Series

CA series bearings have high load capacity, superior durability, and wear resistance featuring a brass cage for various types of large rolls such as suction rolls, press rolls, calender rolls, and reel drum rolls, etc.
The CA series is available in a wide selection of sizes and other specifications, such as bearings with a lubricant hole and groove provided in the outer ring (E4), high heat-resistant bearings capable of withstanding up to 200°C (S11), and high-precision bearings (class 5).

Deep Groove Ball Bearings for High-speed Expander Rolls

Special bearings offer low frictional torque and minimize surface damage, such as smearing and others, through optimal design of the bearing interior and the adoption of coating treatment on the inner and outer rings.
The bearings are characterised by high performance and quality including low-noise bearings suitable for motors and pumps.

Molded-Oil Bearings

Molded-Oil bearings are lubricated with NSK's own oil-impregnated material, Molded-Oil consists of lubricating oil and polyolefin resin that has an affinity for oil. Lubricant slowly seeping from this material provides ample lubrication to the bearing for extended periods.

Features

Excellent performance in water- and dust-contaminated environments

The bearings are designed to prevent liquids such as water, which can wash out the lubricating oil, and dust from getting inside the bearings. Sealed types can be used in environments exposed to water and dust.

*Water and dust dramatically accelerate bearing damage. In order to realize stable operation, we recommend using seals to prevent water and dust from getting in the bearing.

Optimal composition and molding methods enable high-speed operation

Optimization of composition and molding method of Molded-Oil improves strength and enables high-speed operation.

Low torque

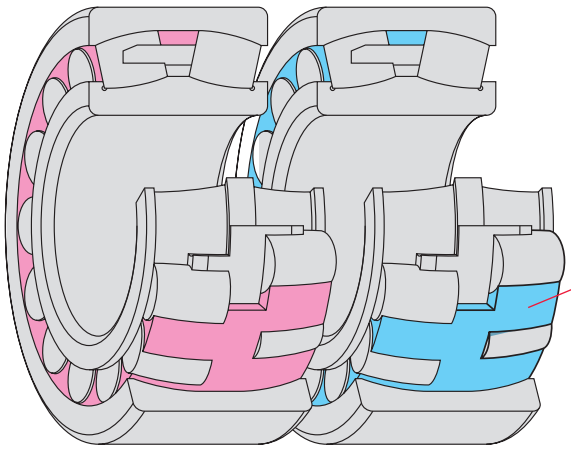

Packing with Molded-Oil after providing the bearing surface with special treatment realizes smooth rotation of rolling elements.

Environmentally friendly

The bearings are lubricated by minute quantities of oil exuded by Molded-Oil, which consequently minimizes oil leakage.

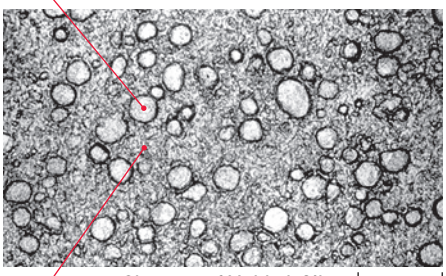

Applications

Material processing equipment (conveyers, agitators), paper mill line equipment (support for wire part rolls), maintenance facilities (carrier rope sheave pulley), and carrier line equipment

For general use For high-speed operation

Portion containing mostly lubricating oil
The lubricating oil is mineral oil-based.

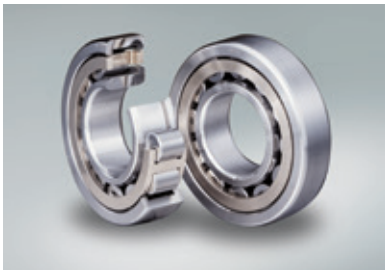

Close-up of Molded-Oil 100 µm

Portion containing mostly polyolefin
Polyolefin is used for packaging food in supermarkets, replacing dioxin-generating vinyl chloride.

These bearings have certain restrictions in regards to ambient operating temperatures and limiting speeds ($d_m n$).

Cylindrical Roller Bearings – EM Series

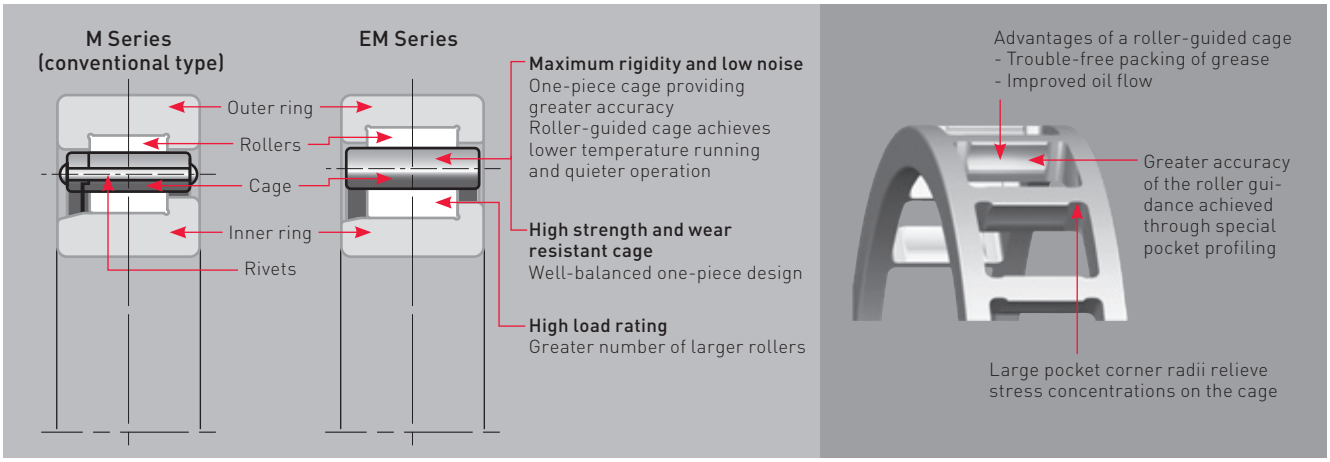

The high-load capacity standard cylindrical roller bearing delivers outstanding performance across a wide range of applications.
High-load capacity is achieved by using more rollers than conventional bearings based on an innovative NSK concept. We also offer standard cylindrical roller bearings for today's needs that provide longer service life and low-noise and low-vibration performance through an optimally designed one-piece cage with high rigidity and low wear.

Features:

Available with innerring bore:
25 mm to 200 mm

Advantages to M Series:

Bearing life approximately 2 times
Low vibration and noise 50 % to 60 % less
Cage strength dramatically enhanced (generated stress cut in half)

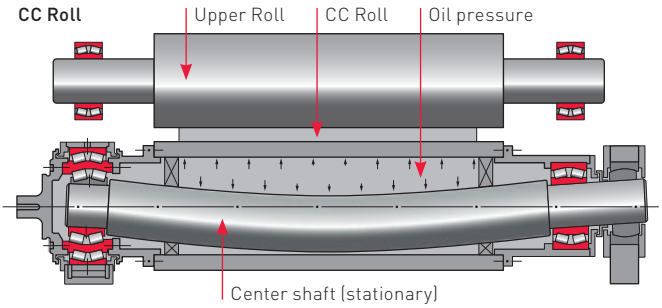

Triple Ring Bearings

Combination tapered roller bearings have typically been used for the outside of controlled crown rolls (CCR) and spherical roller bearings for the inside. Switching to high-precision, high load capacity triple ring bearings prevents creep, facilitates easier mounting, and extends operating life.

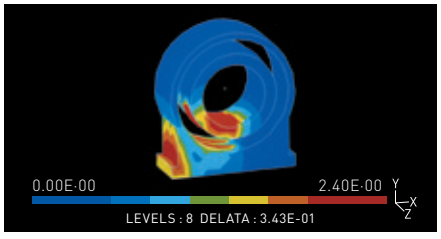

Features:

- **High-load capacity design**
- **Long life vacuum melted, carburised steel**
- **High precision (dimensional and rotational precision)**
- **Optimal inner ring design for lubrication**
- **Lubrication hole and groove provided on inner and outer rings**

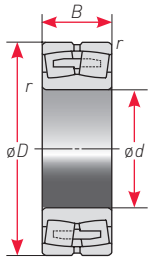

Finite element analysis of housing design for triple ring bearings.

Bearing load distribution is minimised by finite element method (FEM) analysis, thereby contributing to optimal structural design of the housing for paper machine manufacturers.

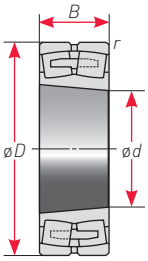

Maximum principle stress distribution

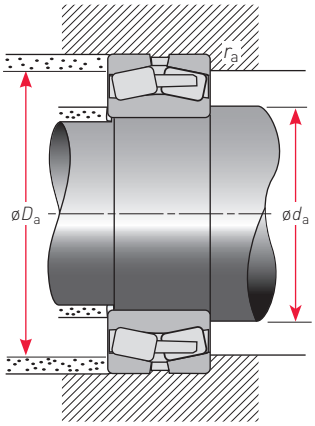

SPHERICAL ROLLER BEARINGS – TL SERIES

Cylindrical bore

Tapered bore

$F_a / F_r \leq e$		$F_a / F_r > e$	
X	Y	X	Y
1	Y_3	0.67	Y_2

Dynamic Equivalent Load
$P = XF_r + YF_a$

Static Equivalent Load
$P_0 = F_r + Y_0F_a$

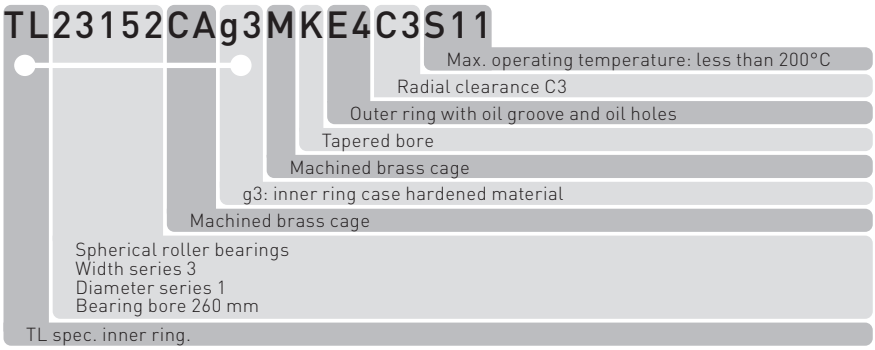

The values of e, Y_2, Y_3 and Y_0 are given in the table below.

Remarks: The suffix E4 indicates that the bering has an oil groove and holes.

SPHERICAL ROLLER BEARINGS – NSKHPS

Cylindrical bore

Tapered bore

$F_a / F_r \leq e$		$F_a / F_r > e$	
X	Y	X	Y
1	Y_3	0.67	Y_2

Dynamic Equivalent Load
$P = XF_r + YF_a$

Static Equivalent Load
$P_0 = F_r + Y_0F_a$

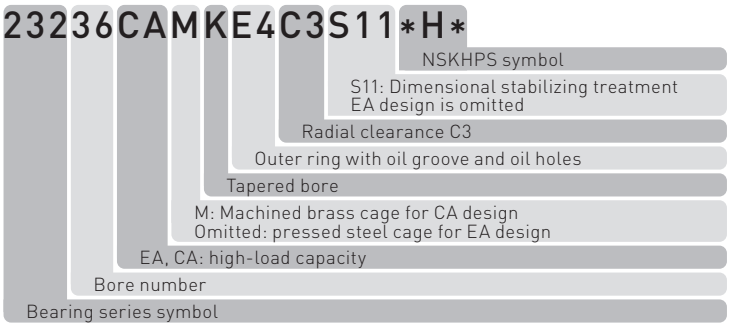

The values of e, Y_2, Y_3 and Y_0 are given in the table below.

Bearing numbers		Boundary dimensions (mm)				Basic load ratings (N)	
Cylindrical bore	Tapered bore [1]	*d*	*D*	*B*	*r* min.	C_r	C_{0r}
22208EAE4	22208EAKE4	40	80	23	1.1	113 000	99 500

RADIAL CLEARANCE IN SPHERICAL ROLLER BEARINGS WITH TAPERED BORES

Bearings with tapered bores are directly mounted onto tapered shafts or cylindrical shafts with adapters or withdrawal sleeves (Fig. 1).
Large bearings are often mounted using hydraulic pressure. Fig. 2 shows a bearing mounting utilising a sleeve and hydraulic nut. Another mounting method is to drill holes in the sleeve which are used to feed oil under pressure to seat the bearing. As the bearing expands radially, the sleeve is inserted axially with adjusting bolts.
The bearing should be mounted with a suitable interference fit by checking residual clearance while measuring their radial-clearance reduction and referring to the amount of axial movement listed in Table 1. Radial clearance must be measured using clearance gauges. As shown in Fig. 3, radial clearance for both rows of rollers must be measured simultaneously, and those two values should be kept roughly the same.
When a large bearing is mounted on a shaft, the outer ring may be deformed into an oval shape by its own weight. If radial clearance is measured at the lowest part of the deformed bearing, the measured value may be greater than the true value. If an incorrect radial internal clearance is obtained in this manner and the value in Table 1 are used, then the interference fit may become too tight and the true residual clearance may become too small. In this case, as shown in Fig. 4, one half of the total clearance at points a and b (which are on a horizontal line passing through the bearing center) and c (which is the lowest position of the bearing) may be used as the residual clearance.

BEARING MAINTENANCE AND INSPECTION

Maintenance

Bearings and operating conditions must be periodically inspected and maintained to maximise bearing life to prevent mechanical failure, ensure reliable operation, raise productivity, and enhance cost performance. Maintenance should be performed regularly according to work standards that may vary according to machine operating conditions. Operating conditions should be monitored, lubricant replenished or changed, and the machine periodically disassembled and overhauled.

1. Inspection under operating conditions

Review lubricant properties, check operating temperatures, and inspect for any vibrations and bearing noise to determine bearing replacement periods and replenishment intervals of the lubricant.

2. Inspection of the bearing

Be sure to thoroughly examine the bearings during periodic machine inspections and part replacement. Check the raceway for any damage and confirm if the bearing can be reused or should be replaced.

Inspection points

Items to be checked while the machine is running should include bearing noise, vibrations, temperature, and lubricant condition.

1. Bearing noise

Sound detection instruments can be used during operation to ascertain the volume and characteristics of bearing rotation noise through sound patterns that are readily distinguishable, which can reveal the presence of bearing damage such as slight flaking. Three typical noise conditions are described in Table 1.

2. Bearing vibration

Bearing irregularities can be analysed by performing a quantitative analysis of vibration amplitude and frequency using a frequency spectrum analyser. Measured data varies depending on the operating conditions of the bearing and the location of the vibration pick-up. Therefore, this method requires the determination of evaluation standards for each measured machine.

Bearing irregularity causes and measures

Irregularities		Possible causes	Measures
Noise	Loud metallic sound	Abnormal load	Improve the fit, internal clearance, preload, or position of housing shoulder
		Incorrect mounting	Improve machining accuracy, alignment accuracy or mounting accuracy of shaft and housing, or use the correct mounting method
		Insufficient or improper lubricant	Replenish the lubricant or select another lubricant
		Contact of rotating parts	Modify the labyrinth seal
	Loud regular sound	Flaws, corrosion, or scratches on race-ways caused by foreign particles	Replace or clean the bearing, improve sealing conditions, or use clean lubricant
		Brinelling	Replace the bearing and use care when handling
		Flaking on raceway	Replace the bearing
	Irregular sound	Excessive clearance	Improve the fit, clearance, or preload
		Contamination by foreign particles	Replace or clean the bearing, improve the seals, and use clean lubricant
		Flaws or flaking on balls	Replace the bearing
Abnormal temperature rise		Excessively small clearance	Improve the fit, clearance, or preload
		Excessive amount of lubricant	Reduce amount of lubricant and select stiffer grease
		Insufficient or improper lubricant	Replenish lubricant or select a proper one
		Abnormal load	Improve the fit, internal clearance, preload, or position of housing shoulder
		Incorrect mounting	Improve machining accuracy, alignment accuracy or mounting accuracy of shaft and housing, or use the correct mounting method
		Creep on fitted surface, or excessive seal friction	Correct the seals, replace the bearing, and correct the fitting or mounting
Vibration (Axial runout)		Brinelling	Replace the bearing, and use care when handling bearings
		Flaking	Replace the bearing
		Incorrect mounting	Correct the squareness between the shaft and housing shoulder or side of spacer
		Penetration of foreign particles	Replace or clean the bearing components and improve sealing
Leakage or discoloration of lubricant		Too much lubricant, or contamination by foreign particles or wear debris	Reduce the amount of lubricant. Select a stiffer grease. Replace the bearing or lubricant. Clean the housing and adjacent parts

EXAMPLES OF BEARING DAMAGE AND COUNTER-MEASURES FOR PAPERMAKING MACHINES

Creep

Bearing type	Application	Cause of damage	Measures
Tapered Roller Bearing	Press CC roll	• Insufficient interference fit	• Tighten interference fit
Spherical Roller Bearing	Dryer canvas roll	• Dimensional variation at high temperatures	• Use TL steel • Use NSKHPS bearing • Apply high-temperature dimensional

Inner ring fracture

Bearing type	Application	Cause of damage	Measures
Spherical Roller Bearing	Dryer cylinder roll	• Excessive force applied during mounting • Defective bore face contact • High hoop stress	• Control residual clearance • Adjust with taper gauge • Use TL steel

Rust and corrosion

Bearing type	Application	Cause of damage	Measures
Spherical Roller Bearing	Wire suction roll	• Insufficient oil film formation due to water entry	• Reinforce lubricating oil control • Improve bearing housing • Anti-rust treatment for idle periods
	Press suction roll	• Rust formed while stationary or being stored	

Flaking

Bearing type	Application	Cause of damage	Measures
Spherical Roller Bearing	Wire suction roll	• Insufficient oil film formation due to water entry	• Reinforce lubricating oil control • Improve bearing housing
	Dryer cylinder roll	• Insufficient oil film formation at high temperatures	• Use TL steel • Increase oil viscosity • Increase volume and reinforce control of lubricating oil temperature • Use thermal insulation sleeve
	Dryer canvas roll	• Excessive axial loading due to expansion of outer ring on the free-end bearing	• Use TL steel • Use NSKHPS bearing • Apply high temperature dimensional stabilizing treatment (S11)

Smearing

Bearing type	Application	Cause of damage	Measures
Spherical Roller Bearing	Calender CC roll (triple ring)	• Insufficient oil film formation	• Increase oil viscosity • Increase oil volume and reinforce control of lubricating oil temperature • Add additives to lubricating oil

Electrical corrosion

Bearing type	Application	Cause of damage	Measures
Deep Groove Ball Bearing Cylindrical Roller Bearing	Motor	• Sparks produced by flow of current where rolling elements contact the raceway	• Design electric circuit which prevents current flow through the bearings • Insulate the bearing
